International Atomic Energy Agency  
P.O.Box 100, A-1400 Vienna, Austria**

**Memo CP-D/714**

**Date:** 26 September  
**To:** Distribution  
**From:** N. Otsuka, S.P. Simakov, V. Semkova, V. Zerkin  
**Subject:** Interdependent data separated by flags

Two data sets of the same REACTION (= reaction + quantity) obtained in the same experimental work are often compiled in the same entry (e.g., same quantity derived by different detectors, different analyses, different runs). There may be systematic deviation between them, and EXFOR users should be able to treat them as two independent data sets. Usually EXFOR systems can treat them as two independent sets if they are given in one subentry with the multiple reaction formalism. However, the systems do not expect the use of flags for such a purpose (the flag can be omitted even if the data set has a column with the heading FLAG).

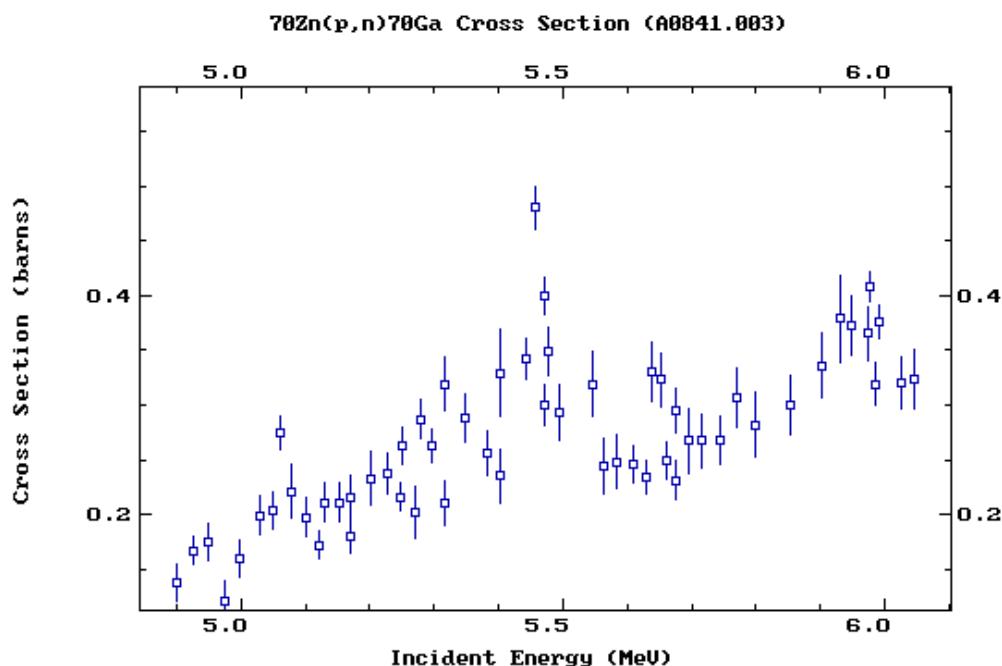

**Example  $^{70}\text{Zn}(\text{p},\text{n})^{70}\text{Ga}$  cross section by two derivation methods**

```

        5000.    161.     17.      2.
        5031.    200.     18.      2.
        5052.    204.     17.      2.
...

```

Usually systems treat this data table as one data set. For example the NDS EXFOR System creates **Plot #1**, where we recognize two data point groups at some energy regions.

## Plot #1

If we introduce the pointer formalism, the NDS EXFOR System can treat them as two different data sets and creates Plot #2.

```

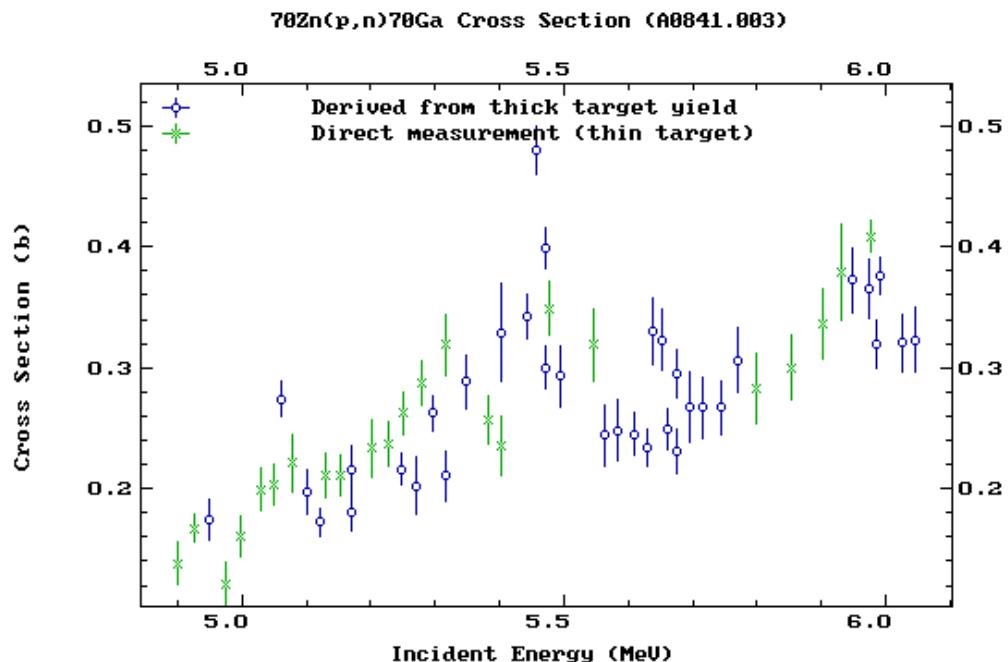

SUBENT      A0841003    20100225
BIB          4           5
REACTION   1(30-ZN-70(P,N)31-GA-70,,SIG,,,DERIV)
            Data deduced from thick target yield
2(30-ZN-70(P,N)31-GA-70,,SIG)
            Data measured for thin target
...
DATA          4           59
EN        DATA      1DATA-ERR  1DATA      2DATA-ERR  2
KEV       MB        MB       MB       MB
4903.          139.      17.
4927.          168.      12.
4952.          175.      17.
4976.          122.      18.
5000.          161.      17.
5031.          200.      18.
5052.          204.      17.
...

```

Note that cross section obtained from the thick target yield is not regarded as the cross sections obtained by most straightforward method, and therefore we have to add DERIV in SF9, too.

**Conclusion:** Compilers should avoid FLAG and use pointers when the data points in one subentry can be divided into several data sets to reflect the different measuring procedure (e.g. flight path), accelerators, neutron sources or detectors, processing of data, repetition of measurements etc.

## Plot #2
